Prologue:

Prologue

Feedback and exercises

- XX of you filled out the feedback survey. Main take-aways:
 - TBA
- What were the main problems with the exercises?

Goals for today

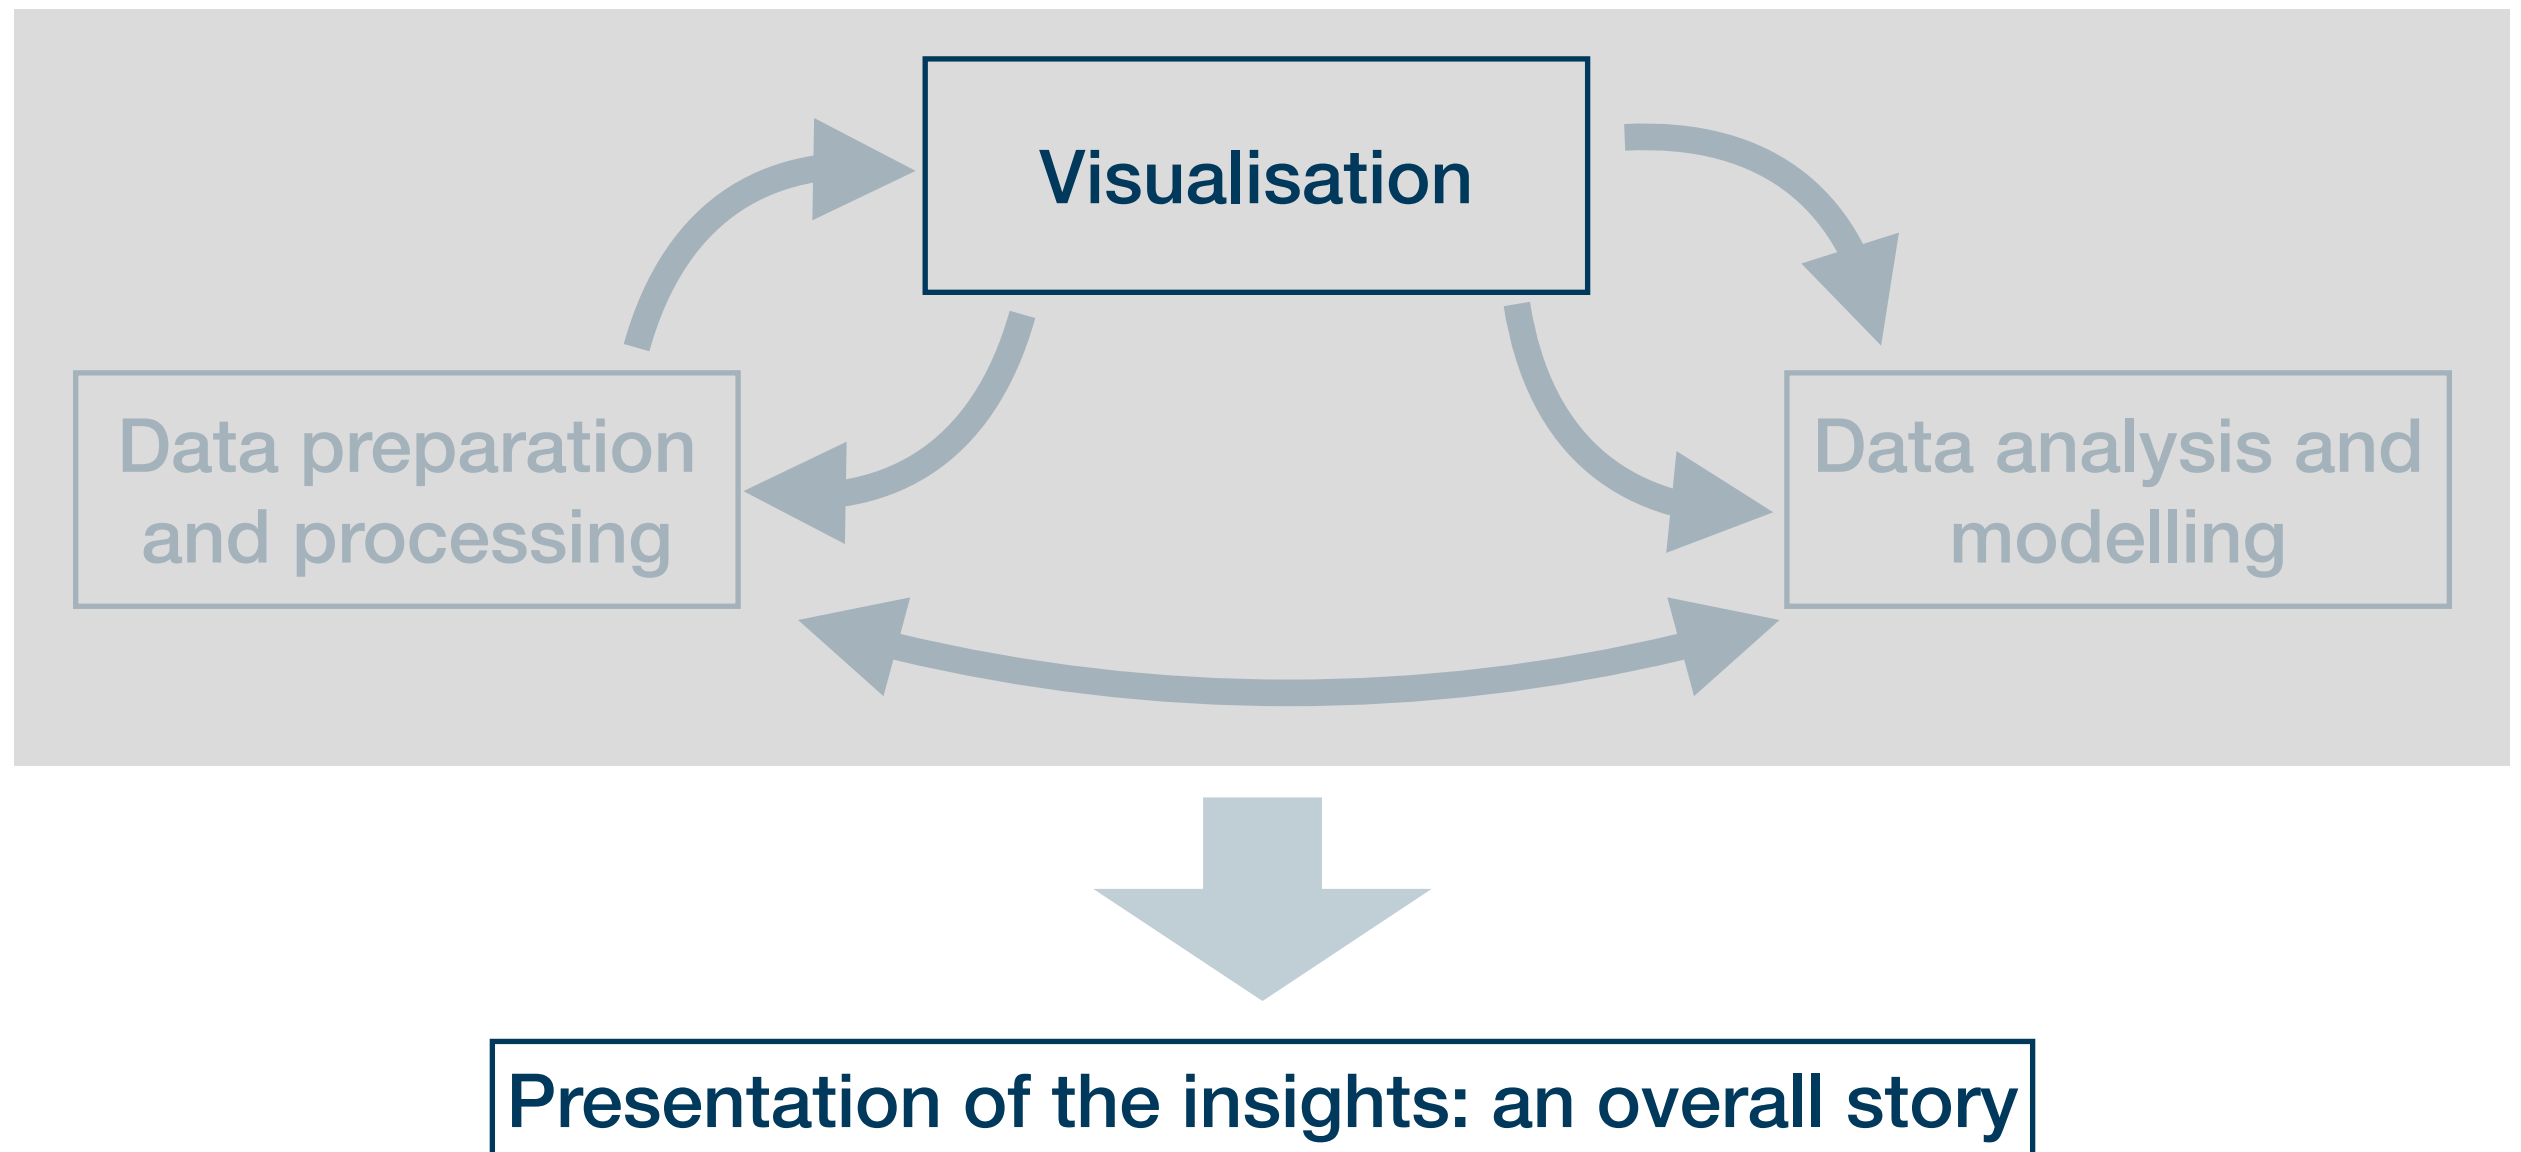

- I. Understand how plots are created layer-wise via the `ggplot2` package
- II. Learn how to map variables in data frames to visual aspects of a plot
- III. Figure out how you can re-use code across different visualisation tasks

Basics of visualization

The role of visualisation in data science

The role of visualisation in data science

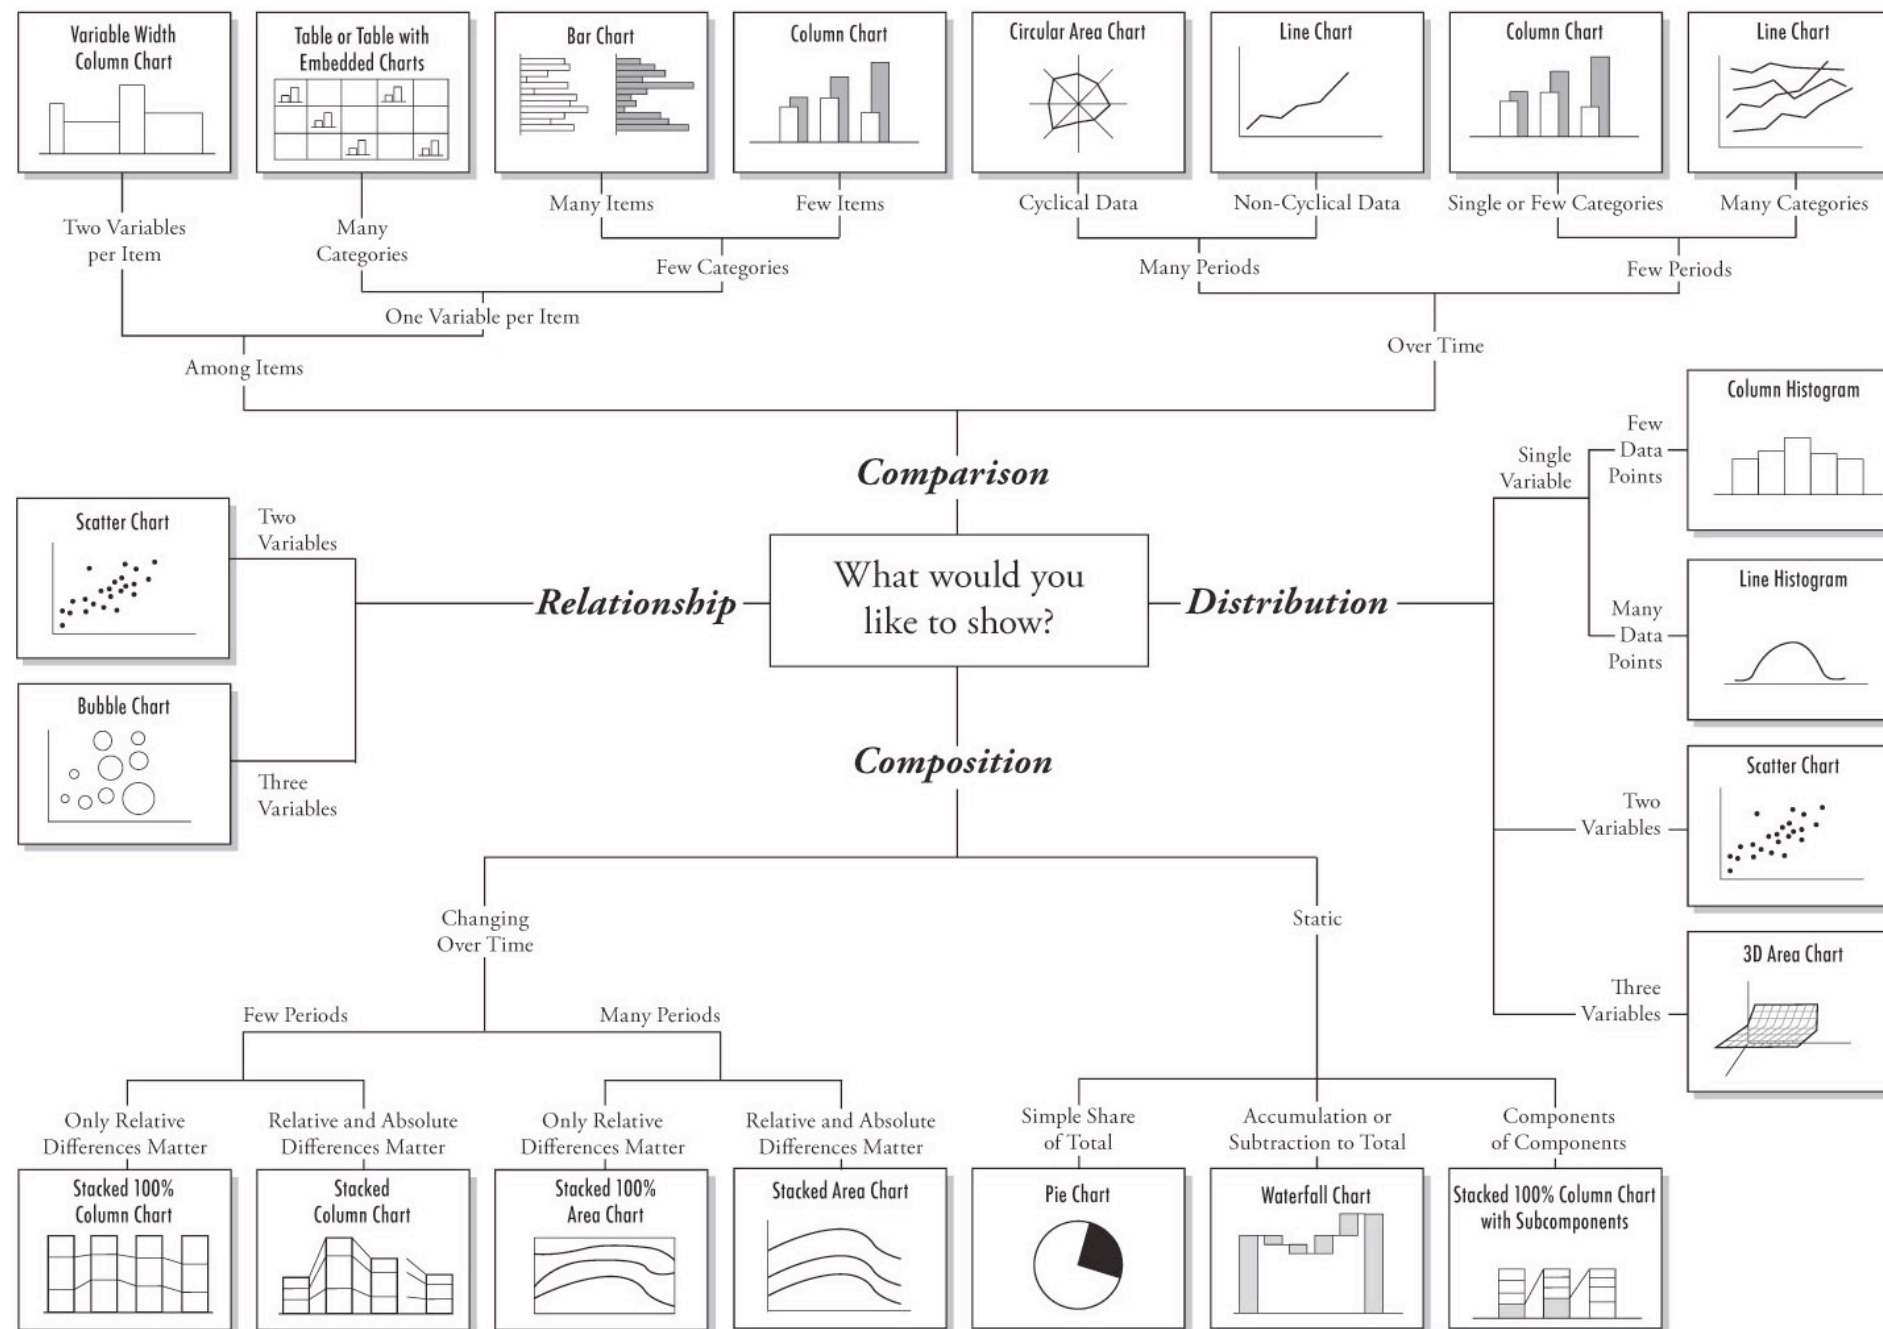

About visualisations

- Visualisations can be used for many purposes
 - Exploratory data analysis → understand your data → prepare/refine models
 - Communication → inform others about your results
 - Manipulation → convince others or recognise others convincing you
- Here we will learn about how to create visualisations using the package ggplot2
- An easy-to-read, widely-used and powerful visualisation engine
- Many great extensions, e.g. for animated GIFs, control charts, and many more...

What kind of plot do you want?

Chart Suggestions—A Thought-Starter

What kind of plot do you want?

- Visualisation always involves prior thinking and theory
- The great thing about **ggplot2** is that the syntax is the same for all graphs
- Once the basic workflow is mastered, it's not difficult to create any of these

- During our lecture we focus on 2 examples:

- The scatterplot/bubble chart from session 1
- A line chart

Readings provide first generalisation

Visual fine-tuning in the second visualisation lecture

The practical workflow

Where we want to go:

- Today we want to get started with visualisations and produce the following two plots:

Life expectancy and income per capita

The divergence of income per capita

- We will see that the mechanics are very similar for different plots
 - Based on the readings you will be able to make even much more plots already now!

The general idea

- Every plot in `ggplot2` is generated in two major steps
 - You describe the plot in all its details via a list ← This is where all the work gets done 😊
 - You call the list and R renders the plot for you ← This is where errors become apparent 🤔
- To create the list-like description, `ggplot2` offers you a ton of helper functions
- You always start with an empty plot, then add layers above this empty plot, adjust details and that's it!
- Lets illustrate this using a subset of the gapminder data set only containing data for the year 2017
 - Readymade available to you via the DataScienceExercises package as `DataScienceExercises::gdplifexp2007`

Developing a ggplot - the general workflow

- Since we are working on the graph development interactively, see my **lecture notes** for documentation purposes

Summary & outlook

Summary

- Visualisations serve many purposes, including the exploration of your data and the communication of your results
- We learned how to visualise data stored in data frames via `ggplot2`
- While there are many different plot variants, their syntax is very similar

`ggplot()` +

`<GEOM_FUNCTION>(
 data = <DATA>
 mapping = aes(<MAPPINGS>),
 stat = <STAT>,
 position = <POSITION>
) +`

`<COORDINATE_FUNCTION> +`

`<FACET_FUNCTION> +`

`<THEME ADJUSTMENTS>`

The geometric forms used to represent the data (points, lines, shades,...)

The data to be visualized

The mapping of the variables in data to the plot aesthetics (x/y-axis, size, form,...)

May be set as defaults within `ggplot()`, or separately for each geom

Adjustment to look, labels, etc.

Summary

- Code for different plots differs mainly by the aesthetic mappings and the geoms used → allows you to re-use a lot of coding heuristics
 - We produced two beautiful plots: a bubble plot and a line graph
- The readings introduce you to other types of plots, which you can easily make more beautiful using the techniques you learned today
- A great way to learn how to plot is to replicate examples from the internet, and adjust them to your own data:

The R Graph Gallery

Outlook

- Next week: how to organise an R project and import data into R
 - This allows us in a next step to transform it into a format we can use for visualisation (and, later, modelling)
 - Up till now we only worked with readymade data sets but in reality, the data you get will be messy → learn to produce data as you have already learned use will open many doors

Tasks until next session:

1. Fill in the **quick feedback survey** on Moodle
2. Do the **readings** posted on the course page → they generalise what you have learned to new plot types
3. Have a look at my lecture notes and redo the plot creation of today
4. Do the **exercises** provided on the course page and **discuss problems** and difficulties via the Moodle forum
